Abstract: With a method first indicated by Ornstein the mean values of all the powers of the velocity u and the displacement s of a free particle in Brownian motion are calculated. It is shown that  $u - u_0 \exp(-\beta t)$  and  $s - u_0 \beta [1 - \exp(-\beta t)]$  where  $u_0$  is the initial velocity and  $\beta$  the friction coefficient divided by the mass of the particle, follow the normal Gaussian distribution law. For s this gives the exact frequency distribution corresponding to the exact formula for  $s^2$  of Ornstein and Fürth. Discussion is given of the connection with the Fokker-Planck partial differential equation. By the same method exact expressions are obtained for the square of the deviation of a harmonically bound particle in Brownian motion as a function of the time and the initial deviation. Here the periodic, aperiodic and overdamped cases have to be treated separately. In the last case, when  $\beta$  is much larger than the frequency and for values of  $t \gg \beta^{-1}$ , the formula takes the form of that previously given by Smoluchowski.
